

Piled Foundations & Underpinning

Environment, Waste & Sustainability Policy

Cohesion Piling Company Ltd (the Company) recognize the need to protect and sustain the environment, minimize waste, minimize the environmental impact of its activities, and so reduce our carbon footprint. In doing so, we will comply with applicable UK legislation.

Some of the company's piling systems do create pile waste including pile spoil. Wherever possible, piling systems are utilized to eliminate pile spoil. However where this is not possible, it is managed and removed by the principal contractor.

To achieve this the Company will:

- Aim to use construction equipment and techniques that minimize the impact of its activities on the environment wherever reasonably possible.
- Eliminate and minimize waste wherever possible.
- Actively seek to reduce the company's carbon footprint whether at source or by adopting procedures and technology to do so.
- Wherever possible, use local suppliers to reduce emissions and the company's carbon footprint.
- Adhere to the principal contractors Site Waste Management plan.
- Aim to use recycled materials wherever possible and technically acceptable.
- Aim to minimize waste and recycle surpluses. This includes packaging etc.
- Dispose of waste responsibly.
- Take all reasonable precautions to mitigate the risk of pollution, including noise pollution.

Our aim is to minimize our affects upon the environment at source, by designing out waste wherever possible.

Gary Kime - Director
